

8. Project Demonstration Phase

1. INTRODUCTION

The Project Demonstration Phase showcases the live, end-to-end execution of **ComicCraft**, presenting the seamless transition from initial user input through automated story and image generation to interactive layout viewing and downloadable PDF creation.

2. OBJECTIVES

Phase 8 focuses on presenting a functional showcase of the application. Key objectives include:

- Launch the active FastAPI backend application server via Uvicorn.
- Access and navigate the interactive user web homepage interface.
- Input standardized story parameters (prompt, character, setting, tone, art style).
- Trigger full-pipeline comic generation.
- Present the resulting panel-by-panel interactive preview.
- Demonstrate character narration, dialogue, and dialogue bubble alignment.
- Display dynamically generated AI panel illustrations.
- Execute PDF export functionality and verify document creation.
- Display export success feedback and preview output files.
- Optionally showcase interactive Swagger OpenAPI documentation at /docs.

3. PHASE WORKFLOW

The demonstration operates on a concrete sample scenario:

- **Story Prompt:** A brave fox exploring an enchanted forest
- **Character Name:** Finn
- **Setting:** Enchanted Forest
- **Tone:** Dramatic
- **Art Style:** Comic Book

4. DETAILED EXPLANATION

The demonstration utilizes real execution outputs from the live configured application environment. Presenters guide evaluators through the complete transformation sequence: initial user prompt entry →

structured outline generation → detailed narrative creation → multi-panel AI image generation → layout composition → compiled PDF generation.

5. GITHUB-READY CODE / STRUCTURE

Commands and web locations for running and showcasing the application live:

```
# Start local ASGI development server
uvicorn app.main:app --reload

# Primary User Web Interface
http://127.0.0.1:8000

# OpenAPI Interactive API Documentation
http://127.0.0.1:8000/docs
```

6. GITHUB FILES & DELIVERABLES

Key Demonstration Artifacts & Repositories:

- **Final GitHub Repository** — Fully integrated, version-controlled codebase.
- **README.md** — Production README featuring installation and execution steps.
- **Source Code** — Clean, modular backend and frontend implementation.
- **Test Evidence** — Test runs, pytest reports, and validation outputs.
- **Screenshots** — Captured images of the UI, panel views, and live execution.
- **Demo Output / PDF** — Exported sample comic PDF files generated during showcase runs.

7. EXPECTED OUTCOME

By the conclusion of Phase 8, the **ComicCraft** application is fully demonstrated, verified live, and showcased across all core features. Completion verification is determined by the student's repository artifacts and successful execution during demonstration evaluations.

8. PHASE CONCLUSION

Phase 8 completes the development and showcase lifecycle of **ComicCraft**. By validating end-to-end user workflows, interactive UI rendering, and PDF exports, this phase confirms project readiness for final evaluation, peer review, and deployment.
